## Mänskliga lager av sårbarheter (Mänskliga misstag)

### Oaktsam

#### Vi gör alla misstag

- Skickar mail till fel person
- Bifogar en fel fil till fel person
- Skickar känslig Data/IP till sig själv
- Ignorerar säkerhetspolicys

### komprometterad

#### Vi kan alla bli påverkade

- Kan bli påtvingad/påtryckt internt eller externt
- Kan bli lurad
- Övertalad att dela data

### Uppsåtlig

#### Vi har ibland elakartade uppsåt

- Stjäl företagets data
- Dåliga avslut på anställning
- Kan bli hackade
- Kan bli utpressade

## Mänsklig risk

Faller för social engineering  
Lämna över credentials  
Kör kod dom absolut inte borde  
Hantera data felaktigt data

## AI risk

Faller för prompt engineering  
Lämna över credentials  
Kör kod dom absolut inte borde  
Hantera data felaktigt

|                                                                                                              |                                                                                                   |                                                                                              |                                                                                                |                                                                                                                              |                                                                                                                       |                                                                                              |                                                                                                         |                                                                                                         |                                                                                                                     |                                                                                                         |                                                                                                                      |                                                                                                                         |                                                                                                           |                                                                                                                       |                                                                                                           |                                                                                                                              |

Misstag

Program

# Kan man få 100% utan false positive/negative tack?

- Förstå var data kommer ifrån
- 100% precision – utan konstiga DLP taggar/klassningar/
- Skapa egna data-strömmar eller beteenden som får göras

File exported or copy/paste from sensitive app (Workday)

workday.

100% blocked from web upload or paste to webmail

Allowed web upload to sanctioned SaaS

# Human-centric: Få insikter vad uppsåtet är

- Namnbyte på filen
- Web & App användning
- Dataexfiltrering
- Riktigt innehåll

# Implementera Generative AI med gardering

- Detektera och blockera när användare klistrar in eller laddar upp data i Promptar – som är skadliga

## Värde

- Kör på med AI, men minska risken för Omedvetet eller medvetet data läckage.

1

Användare skriver eller klistrar i promptar som anses skadliga

2

Utbilda användaren direkt på AI strategin

# Men resultatet blir ju automatiskt känslig data.....
