

# Establishing Essential Cyber Hygiene

April 2022

# Acknowledgments

The Center for Internet Security® (CIS®) would like to thank the many security experts who volunteer their time and talent to support the CIS Critical Security Controls® (CIS Controls®) and other CIS work. CIS products represent the effort of a veritable army of volunteers from across the industry, generously giving their time and talent in the name of a more secure online experience for everyone.

# Introduction

In general, many cyber-attacks can be attributed to a lack of good cyber hygiene. Simple enough, but there is an important idea in here. Study after study, and test after test gives us the same depressing result. Almost all successful attacks take advantage of conditions that could reasonably be described as “poor hygiene” including:

- Failure to patch known vulnerabilities
- Poor configuration management
- Inefficient management of administrative privileges

At CIS, we attribute these failures primarily to the complexity of modern systems management, as well as a noisy and confusing environment of technology, marketplace claims, and oversight/regulation (“The Fog of More”). Defenders are overwhelmed. Therefore, any large-scale security improvement program needs a way to bring focus and attention to the most effective and fundamental things that need to be done.

We do this at CIS by moving “cyber hygiene” from a notion or tagline into a campaign of specific actions, supported by a complementary market ecosystem of content, tools, training, and services. Recently, we codified our definition of “essential cyber hygiene” as consisting of the Safeguards found in [Implementation Group 1 \(IG1\)](#) of the CIS Critical Security Controls (CIS Controls). By defining IG1, we can then specify tools that can be put in place to implement the actions, measurements to track progress or maturity, and reporting that can be used to manage an enterprise improvement program. In today’s environment of shared technology, linked by complex business relationships and hidden dependencies, this approach provides a specific way to negotiate “trust” and an “expectation” of security. (Are you a safe partner to bring into my supply chain? Can I count on this merchant to safely hold my financial information?) This approach is better than paper surveys or inconsistent interpretation of abstract security requirements.

IG1 is not just another list of good things to do; it is an *essential* set of steps that helps all enterprises deal with the most common types of attacks we see in real life. Our recent release of the CIS [Community Defense Model v2.0](#) provides the technical underpinning for that declaration.

The Center for Internet Security and its divisions, the Multi-State Information Sharing and Analysis Center® (MS-ISAC®) and Elections Infrastructure Information Sharing and Analysis Center® (EI-ISAC®), are offering this *guide* as a resource to assist with the implementation of essential cyber hygiene, in alignment with the Nationwide Cybersecurity Review (NCSR) and National Institute of Standards and Technology® Cybersecurity Framework (NIST® CSF), by providing the tools, resources, and templates that are needed.

# How to Get Started

When tasked to implement a cybersecurity program, many enterprises ask “How do we get started?” In response, the Controls Community sorted the Safeguards in the CIS Controls into three [Implementation Groups \(IGs\)](#) based on their difficulty and cost to implement. IG1 is the group that is least costly and difficult to implement and are the Safeguards we assert that every enterprise should deploy. Applying all of the Safeguards listed in IG1 will help thwart general, non-targeted attacks and strengthen an enterprise’s security program. IG1 is the definition of *essential cyber hygiene* and represents a minimum standard of information security for all enterprises. We acknowledge that a listing of activities will not be the silver bullet for all security threats, but aim to provide activities for defending against common threats. For enterprises that face more sophisticated attacks or that must protect more critical data or systems, IG1 Safeguards provide the foundation for the other two Implementation Groups (IG2 and IG3).

Enterprises should first review this guide, which will provide an overview of each Safeguard in IG1 as well as why they are important to implement. Resources, tools, and policy templates that can be used to help facilitate implementation of these Safeguards are provided after the applicable Safeguard information, as well as in [Appendices A and B](#) of this guide. Enterprises can learn more about how they can gain access to multiple cybersecurity tools and resources, at no cost, through a CIS SecureSuite® Membership and MS- and EI-ISAC membership.

# IG1 Safeguards: CIS Controls v8

The CIS Controls are a prioritized set of defensive actions aimed to protect enterprises from the most common attacks. They are developed by a community of information technology (IT) experts who apply their first-hand experience as cyber defenders to create these globally accepted security best practices. Each CIS Control includes smaller actions, known as CIS Safeguards, which focus on measurable actions so you can more easily track your progress in applying effective protection against common attacks. There are 153 Safeguards in CIS Controls v8.

As previously mentioned, in an effort to simplify and prioritize the process of effectively implementing the CIS Controls, CIS created three IGs—IG1, IG2, and IG3, as shown below. IGs are based on the risk profile and resources an enterprise has available to them to implement the CIS Controls. Each IG identifies a set of Safeguards that they need to implement. IG1, “essential cyber hygiene,” provides effective security value with technology and processes that are generally already available while providing a basis for more tailored and sophisticated action, if warranted. Building upon IG1 is an additional set of Safeguards (IG2) for enterprises with more resources and expertise, but also greater risk exposure. Finally, the rest of the Safeguards make up IG3, for enterprises with the greatest risk exposure.

The number of Safeguards an enterprise is expected to implement increases based on which group the enterprise falls into.

**153**  
TOTAL SAFEGUARDS

**IG3**

IG3 assists enterprises with IT security experts to secure sensitive and confidential data. IG3 aims to prevent and/or lessen the impact of sophisticated attacks.

**23**  
SAFEGUARDS

**IG2**

IG2 assists enterprises managing IT infrastructure of multiple departments with differing risk profiles. IG2 aims to help enterprises cope with increased operational complexity.

**74**  
SAFEGUARDS

**IG1**

IG1 is the definition of essential cyber hygiene and represents a minimum standard of information security for all enterprises. IG1 assists enterprises with limited cybersecurity expertise thwart general, non-targeted attacks.

SAFEGUARDS

# Inventory and Control of Enterprise Assets

## Overview

Actively manage (inventory, track, and correct) all enterprise assets (end-user devices, including portable and mobile; network devices; non-computing/Internet of Things (IoT) devices; and servers) connected to the infrastructure physically, virtually, remotely, and those within cloud environments, to accurately know the totality of assets that need to be monitored and protected within the enterprise. This will also support identifying unauthorized and unmanaged assets to remove or remediate.

## Why It Matters?

Enterprises cannot defend what they do not know they have. Managed control of all enterprise assets also plays a critical role in security monitoring, incident response, system backup, and recovery. Enterprises should know what data is critical to them (CIS Control 3), and proper asset management will help identify those enterprise assets that hold or manage this critical data, so that appropriate security controls can be applied.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
1.1	Identify	<p><b>Establish and Maintain Detailed Enterprise Asset Inventory</b></p> <p>Establish and maintain an accurate, detailed, and up-to-date inventory of all enterprise assets with the potential to store or process data, to include: end-user devices (including portable and mobile), network devices, non-computing/IoT devices, and servers. Ensure the inventory records the network address (if static), hardware address, machine name, enterprise asset owner, department for each asset, and whether the asset has been approved to connect to the network. For mobile end-user devices, MDM type tools can support this process, where appropriate. This inventory includes assets connected to the infrastructure physically, virtually, remotely, and those within cloud environments. Additionally, it includes assets that are regularly connected to the enterprise's network infrastructure, even if they are not under control of the enterprise. Review and update the inventory of all enterprise assets bi-annually, or more frequently.</p>
1.2	Respond	<p><b>Address Unauthorized Assets</b></p> <p>Ensure that a process exists to address unauthorized assets on a weekly basis. The enterprise may choose to remove the asset from the network, deny the asset from connecting remotely to the network, or quarantine the asset.</p>

# CIS CONTROL 02 Inventory and Control of Software Assets

**Overview** Actively manage (inventory, track, and correct) all software (operating systems and applications) on the network so that only authorized software is installed and can execute, and that unauthorized and unmanaged software is found and prevented from installation or execution.

**Why It Matters?** A complete software inventory is a critical foundation for preventing attacks. Attackers continuously scan target enterprises looking for vulnerable versions of software that can be remotely exploited. For example, if a user opens a malicious website or attachment with a vulnerable browser, an attacker can often install backdoor programs and bots that give the attacker long-term control of the system. Attackers can also use this access to move laterally through the network. One of the key defenses against these attacks is updating and patching software (CIS Control 7). However, without a complete inventory of software assets, an enterprise cannot determine if they have vulnerable software, or if there are potential licensing violations.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
2.1	Identify	<b>Establish and Maintain a Software Inventory</b> Establish and maintain a detailed inventory of all licensed software installed on enterprise assets. The software inventory must document the title, publisher, initial install/use date, and business purpose for each entry; where appropriate, include the Uniform Resource Locator (URL), app store(s), version(s), deployment mechanism, and decommission date. Review and update the software inventory bi-annually, or more frequently.
2.2	Identify	<b>Ensure Authorized Software is Currently Supported</b> Ensure that only currently supported software is designated as authorized in the software inventory for enterprise assets. If software is unsupported, yet necessary for the fulfillment of the enterprise's mission, document an exception detailing mitigating controls and residual risk acceptance. For any unsupported software without an exception documentation, designate as unauthorized. Review the software list to verify software support at least monthly, or more frequently.
2.3	Respond	<b>Address Unauthorized Software</b> Ensure that unauthorized software is either removed from use on enterprise assets or receives a documented exception. Review monthly, or more frequently.

# CIS CONTROL 03 Data Protection

**Overview** Develop processes and technical controls to identify, classify, securely handle, retain, and dispose of data.

**Why It Matters?** Data is no longer only contained within an enterprise's border; it is in the cloud, on portable end-user devices where users work from home, and is often shared with partners or online services that might have it anywhere in the world. In addition to sensitive data an enterprise holds related to finances, intellectual property, and customer data, there also might be numerous international regulations for protection of personal data. Data privacy has become increasingly important, and enterprises are learning that privacy is about the appropriate use and management of data, not just encryption. Data must be appropriately managed through its entire life cycle. These privacy rules can be complicated for multi-national enterprises of any size; however, there are fundamentals that can apply to all.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
3.1	Identify	<b>Establish and Maintain a Data Management Process</b> Establish and maintain a data management process. In the process, address data sensitivity, data owner, handling of data, data retention limits, and disposal requirements, based on sensitivity and retention standards for the enterprise. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
3.2	Identify	<b>Establish and Maintain a Data Inventory</b> Establish and maintain a data inventory, based on the enterprise's data management process. Inventory sensitive data, at a minimum. Review and update inventory annually, at a minimum, with a priority on sensitive data.
3.3	Protect	<b>Configure Data Access Control Lists</b> Configure data access control lists based on a user's need to know. Apply data access control lists, also known as access permissions, to local and remote file systems, databases, and applications.
3.4	Protect	<b>Enforce Data Retention</b> Retain data according to the enterprise's data management process. Data retention must include both minimum and maximum timelines.
3.5	Protect	<b>Securely Dispose of Data</b> Securely dispose of data as outlined in the enterprise's data management process. Ensure the disposal process and method are commensurate with the data sensitivity.
3.6	Protect	<b>Encrypt Data on End-User Devices</b> Encrypt data on end-user devices containing sensitive data. Example implementations can include: Windows BitLocker®, Apple FileVault®, Linux® dm-crypt.

## Overview

Establish and maintain the secure configuration of enterprise assets (end-user devices, including portable and mobile; network devices; non-computing/IoT devices; and servers) and software (operating systems and applications).

## Why It Matters?

As delivered from manufacturers and resellers, the default configurations for enterprise assets and software are normally geared towards ease-of-deployment and ease-of-use, rather than security. Basic controls, open services and ports, default accounts or passwords, pre-configured Domain Name System (DNS) settings, older (vulnerable) protocols, and pre-installation of unnecessary software can all be exploitable if left in their default state. Further, these security configuration updates need to be managed and maintained over the life cycle of enterprise assets and software. Configuration updates need to be tracked and approved through configuration management workflow process to maintain a record that can be reviewed for compliance, leveraged for incident response, and to support audits. This CIS Control is important to on-premises devices, as well as remote devices, network devices, and cloud environments.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
4.1	Protect	<b>Establish and Maintain a Secure Configuration Process</b> Establish and maintain a secure configuration process for enterprise assets (end-user devices, including portable and mobile, non-computing/IoT devices, and servers) and software (operating systems and applications). Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
4.2	Protect	<b>Establish and Maintain a Secure Configuration Process for Network Infrastructure</b> Establish and maintain a secure configuration process for network devices. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
4.3	Protect	<b>Configure Automatic Session Locking on Enterprise Assets</b> Configure automatic session locking on enterprise assets after a defined period of inactivity. For general purpose operating systems, the period must not exceed 15 minutes. For mobile end-user devices, the period must not exceed 2 minutes.
4.4	Protect	<b>Implement and Manage a Firewall on Servers</b> Implement and manage a firewall on servers, where supported. Example implementations include a virtual firewall, operating system firewall, or a third-party firewall agent.
4.5	Protect	<b>Implement and Manage a Firewall on End-User Devices</b> Implement and manage a host-based firewall or port-filtering tool on end-user devices, with a default-deny rule that drops all traffic except those services and ports that are explicitly allowed.
4.6	Protect	<b>Securely Manage Enterprise Assets and Software</b> Securely manage enterprise assets and software. Example implementations include managing configuration through version-controlled-infrastructure-as-code and accessing administrative interfaces over secure network protocols, such as Secure Shell (SSH) and Hypertext Transfer Protocol Secure (HTTPS). Do not use insecure management protocols, such as Telnet (Teletype Network) and HTTP, unless operationally essential.
4.7	Protect	<b>Manage Default Accounts on Enterprise Assets and Software</b> Manage default accounts on enterprise assets and software, such as root, administrator, and other pre-configured vendor accounts. Example implementations can include: disabling default accounts or making them unusable.

# CIS CONTROL 05 Account Management

**Overview** Use processes and tools to assign and manage authorization to credentials for user accounts, including administrator accounts, as well as service accounts, to enterprise assets and software.

**Why It Matters?** It is easier for an external or internal threat actor to gain unauthorized access to enterprise assets or data through using valid user credentials than through “hacking” the environment. There are many ways to covertly obtain access to user accounts, including: weak passwords, accounts still valid after a user leaves the enterprise, dormant or lingering test accounts, shared accounts that have not been changed in months or years, service accounts embedded in applications for scripts, a user having the same password as one they use for an online account that has been compromised (in a public password dump), using social engineering techniques to obtain a password, or using malware to capture passwords or tokens in memory or over the network. Defenders need to ensure that controls are in place to protect enterprise accounts, especially those with higher privileges.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
5.1	Identify	<b>Establish and Maintain an Inventory of Accounts</b> Establish and maintain an inventory of all accounts managed in the enterprise. The inventory must include both user and administrator accounts. The inventory, at a minimum, should contain the person's name, username, start/stop dates, and department. Validate that all active accounts are authorized, on a recurring schedule at a minimum quarterly, or more frequently.
5.2	Protect	<b>Use Unique Passwords</b> Use unique passwords for all enterprise assets. Best practice implementation includes, at a minimum, an 8-character password for accounts using MFA and a 14-character password for accounts not using MFA.
5.3	Respond	<b>Disable Dormant Accounts</b> Delete or disable any dormant accounts after a period of 45 days of inactivity, where supported.
5.4	Protect	<b>Restrict Administrator Privileges to Dedicated Administrator Accounts</b> Restrict administrator privileges to dedicated administrator accounts on enterprise assets. Conduct general computing activities, such as internet browsing, email, and productivity suite use, from the user's primary, non-privileged account.

## Tools and Resources

<a href="#">CIS Build Kits</a>	ZIP files that contain a GPO for each profile within the corresponding CIS Benchmark	5.4

# CIS CONTROL 06 Access Control Management

**Overview** Use processes and tools to create, assign, manage, and revoke access credentials and privileges for user, administrator, and service accounts for enterprise assets and software.

**Why It Matters?** Where CIS Control 5 deals specifically with account management, CIS Control 6 focuses on managing what access these accounts have, ensuring users only have access to the data or enterprise assets appropriate for their role, and ensuring that there is strong authentication for critical or sensitive enterprise data or functions. Attackers will compromise any account that will grant them access to a network, especially administrator accounts that have elevated privileges. Accounts should only have the minimal authorization needed for the role. Developing consistent access rights for each role and assigning roles to users is a best practice. Developing a program for complete provision and de-provisioning access is also important. Centralizing this function is ideal.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
6.1	Protect	<b>Establish an Access Granting Process</b> Establish and follow a process, preferably automated, for granting access to enterprise assets upon new hire, rights grant, or role change of a user.
6.2	Protect	<b>Establish an Access Revoking Process</b> Establish and follow a process, preferably automated, for revoking access to enterprise assets, through disabling accounts immediately upon termination, rights revocation, or role change of a user. Disabling accounts, instead of deleting accounts, may be necessary to preserve audit trails.
6.3	Protect	<b>Require MFA for Externally-Exposed Applications</b> Require all externally-exposed enterprise or third-party applications to enforce MFA, where supported. Enforcing MFA through a directory service or SSO provider is a satisfactory implementation of this Safeguard.
6.4	Protect	<b>Require MFA for Remote Network Access</b> Require MFA for remote network access.
6.5	Protect	<b>Require MFA for Administrative Access</b> Require MFA for all administrative access accounts, where supported, on all enterprise assets, whether managed on-site or through a third-party provider.

# CIS CONTROL 07 Continuous Vulnerability Management

## Overview

Develop a plan to continuously assess and track vulnerabilities on all enterprise assets within the enterprise's infrastructure, in order to remediate, and minimize, the window of opportunity for attackers. Monitor public and private industry sources for new threat and vulnerability information.

## Why It Matters?

Thousands of vulnerabilities are published each year, with several more that are unknown. Cyber defenders are constantly being challenged from attackers who are looking for vulnerabilities within their infrastructure to exploit and gain access. Defenders must have timely threat information available to them about: software updates, patches, security advisories, threat bulletins, etc., and they should regularly review their environment to identify these vulnerabilities before the attackers do. Understanding and managing vulnerabilities is a continuous activity, requiring focus of time, attention, and resources.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
7.1	Protect	<b>Establish and Maintain a Vulnerability Management Process</b> Establish and maintain a documented vulnerability management process for enterprise assets. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
7.2	Respond	<b>Establish and Maintain a Remediation Process</b> Establish and maintain a risk-based remediation strategy documented in a remediation process, with monthly, or more frequent, reviews.
7.3	Protect	<b>Perform Automated Operating System Patch Management</b> Perform operating system updates on enterprise assets through automated patch management on a monthly, or more frequent, basis.
7.4	Protect	<b>Perform Automated Application Patch Management</b> Perform application updates on enterprise assets through automated patch management on a monthly, or more frequent, basis.

## Tools and Resources

# CIS CONTROL 08 Audit Log Management

**Overview** Collect, alert, review, and retain audit logs of events that could help detect, understand, or recover from an attack.

**Why It Matters?** Log collection and analysis is important for an enterprise's ability to detect malicious activity quickly. Sometimes audit records are the only evidence of a successful attack. Attackers know that many enterprises keep audit logs for compliance purposes, but rarely analyze them. They know there's very little risk of being exposed through the audit logs if the logs are never analyzed. As a result, attackers use this knowledge to hide their location, malicious software, and activities on victim machines. Due to poor or nonexistent log analysis processes, attackers sometimes control victim machines for months or years without anyone in the target enterprise knowing. Logging records are critical for incident response. After an attack has been detected, log analysis can help enterprises understand the extent of an attack.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
8.1	Protect	<b>Establish and Maintain an Audit Log Management Process</b> Establish and maintain an audit log management process that defines the enterprise's logging requirements. At a minimum, address the collection, review, and retention of audit logs for enterprise assets. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
8.2	Detect	<b>Collect Audit Logs</b> Collect audit logs. Ensure that logging, per the enterprise's audit log management process, has been enabled across enterprise assets.
8.3	Protect	<b>Ensure Adequate Audit Log Storage</b> Ensure that logging destinations maintain adequate storage to comply with the enterprise's audit log management process.

**Overview**

Improve protections and detections of threats from email and web vectors, as these are opportunities for attackers to manipulate human behavior through direct engagement.

**Why It Matters?**

Web browsers and email clients are very common points of entry for attackers because of their direct interaction with users inside an enterprise. Content can be crafted to entice or spoof users into disclosing credentials, providing sensitive data, or providing an open channel to allow attackers to gain access, thus increasing risk to the enterprise. Since email and web are the main means that users interact with external and untrusted users and environments, these are prime targets for both malicious code and social engineering. Additionally, as enterprises move to web-based email, or mobile email access, users no longer use traditional full-featured email clients, which provide embedded security controls like connection encryption, strong authentication, and phishing reporting buttons. Defenders must ensure that browsers and email clients are kept up to date and that other activities, such as using DNS filtering services, are implemented to reduce the risk of a system communicating with a malicious domain.

**Safeguards**

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
9.1	<b>Protect</b>	<b>Ensure Use of Only Fully Supported Browsers and Email Clients</b> Ensure only fully supported browsers and email clients are allowed to execute in the enterprise, only using the latest version of browsers and email clients provided through the vendor.
9.2	<b>Protect</b>	<b>Use DNS Filtering Services</b> Use DNS filtering services on all enterprise assets to block access to known malicious domains.

# CIS CONTROL 10 Malware Defenses

**Overview** Prevent or control the installation, spread, and execution of malicious applications, code, or scripts on enterprise assets.

**Why It Matters?** Malicious software (sometimes categorized as viruses or Trojans) is an integral and dangerous aspect of internet threats. They can have many purposes, from capturing credentials, stealing data, identifying other targets within the network, and encrypting or destroying data. Malware is ever-evolving and adaptive, as modern variants leverage machine learning techniques. Malware defenses must be able to operate in this dynamic environment through automation, timely and rapid updating, and integration with other processes like vulnerability management and incident response. They must be deployed at all possible entry points and enterprise assets to detect, prevent spread, or control the execution of malicious software or code.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
10.1	Protect	<b>Deploy and Maintain Anti-Malware Software</b> Deploy and maintain anti-malware software on all enterprise assets.
10.2	Protect	<b>Configure Automatic Anti-Malware Signature Updates</b> Configure automatic updates for anti-malware signature files on all enterprise assets.
10.3	Protect	<b>Disable Autorun and Autoplay for Removable Media</b> Disable autorun and autoplay auto-execute functionality for removable media.

# CIS CONTROL 11 Data Recovery

**Overview** Establish and maintain data recovery practices sufficient to restore in-scope enterprise assets to a pre-incident and trusted state.

**Why It Matters?** There has been an exponential rise in ransomware over the last few years. It is not a new threat, though it has become more commercialized and organized as a reliable method for attackers to make money. If an attacker encrypts an enterprise's data and demands ransom for its restoration, having a recent backup to recover to a known, trusted state can be helpful. However, as ransomware has evolved, it has also become an extortion technique, where data is exfiltrated before being encrypted, and the attacker asks for payment to restore the enterprise's data, as well as to keep it from being sold or publicized. In this case, restoration would only solve the issue of restoring systems to a trusted state and continuing operations. Leveraging the guidance within IG1 of the CIS Controls will help reduce the risk of ransomware through improved cyber hygiene, as attackers usually use older or basic exploits on insecure systems.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
11.1	Recover	<b>Establish and Maintain a Data Recovery Process</b> Establish and maintain a data recovery process. In the process, address the scope of data recovery activities, recovery prioritization, and the security of backup data. Review and update documentation annually, or when significant enterprise changes occur that could impact this Safeguard.
11.2	Recover	<b>Perform Automated Backups</b> Perform automated backups of in-scope enterprise assets. Run backups weekly, or more frequently, based on the sensitivity of the data.
11.3	Protect	<b>Protect Recovery Data</b> Protect recovery data with equivalent controls to the original data. Reference encryption or data separation, based on requirements.
11.4	Recover	<b>Establish and Maintain an Isolated Instance of Recovery Data</b> Establish and maintain an isolated instance of recovery data. Example implementations include version controlling backup destinations through offline, cloud, or off-site systems or services.

# CIS CONTROL 12 Network Infrastructure Management

**Overview** Establish, implement, and actively manage (track, report, correct) network devices, in order to prevent attackers from exploiting vulnerable network services and access points.

**Why It Matters?** Secure network infrastructure is an essential defense against attacks. Network infrastructure includes devices such as physical and virtualized gateways, firewalls, wireless access points, routers, and switches. Default configurations for network devices are geared for ease-of-deployment and ease-of-use—not security. Potential default vulnerabilities include open services and ports, default accounts and passwords (including service accounts), support for older vulnerable protocols, and pre-installation of unnecessary software. Attackers search for vulnerable default settings, gaps or inconsistencies in firewall rule sets, routers, and switches and use those holes to penetrate defenses. They exploit flaws in these devices to gain access to networks, redirect traffic on a network, and intercept data while in transmission. Ensuring that network infrastructure is kept up to date as well as establishing secure configurations (Safeguard 4.2) is an important line of defense to mitigate the risk of an attack.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
12.1	Protect	<b>Ensure Network Infrastructure is Up-to-Date</b> Ensure network infrastructure is kept up-to-date. Example implementations include running the latest stable release of software and/or using currently supported network-as-a-service (NaaS) offerings. Review software versions monthly, or more frequently, to verify software support.

# CIS CONTROL 14

## Security Awareness and Skills Training

### Overview

Establish and maintain a security awareness program to influence behavior among the workforce to be security conscious and properly skilled to reduce cybersecurity risks to the enterprise.

### Why It Matters?

The actions of people play a critical part in the success or failure of an enterprise's security program. It is easier for an attacker to entice a user to click a link or open an email attachment to install malware in order to get into an enterprise, than to find a network exploit to do it directly. Users themselves, both intentionally and unintentionally, can cause incidents as a result of mishandling sensitive data, sending an email with sensitive data to the wrong recipient, losing a portable end-user device, using weak passwords, or using the same password they use on public sites. No security program can effectively address cyber risk without a means to address this fundamental human vulnerability. An enterprise's training material should be reviewed and updated regularly. This will increase the culture of security and discourage risky workarounds.

### Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
14.1	Protect	<b>Establish and Maintain a Security Awareness Program</b> Establish and maintain a security awareness program. The purpose of a security awareness program is to educate the enterprise's workforce on how to interact with enterprise assets and data in a secure manner. Conduct training at hire and, at a minimum, annually. Review and update content annually, or when significant enterprise changes occur that could impact this Safeguard.
14.2	Protect	<b>Train Workforce Members to Recognize Social Engineering Attacks</b> Train workforce members to recognize social engineering attacks, such as phishing, pre-texting, and tailgating.
14.3	Protect	<b>Train Workforce Members on Authentication Best Practices</b> Train workforce members on authentication best practices. Example topics include MFA, password composition, and credential management.
14.4	Protect	<b>Train Workforce on Data Handling Best Practices</b> Train workforce members on how to identify and properly store, transfer, archive, and destroy sensitive data. This also includes training workforce members on clear screen and desk best practices, such as locking their screen when they step away from their enterprise asset, erasing physical and virtual whiteboards at the end of meetings, and storing data and assets securely.
14.5	Protect	<b>Train Workforce Members on Causes of Unintentional Data Exposure</b> Train workforce members to be aware of causes for unintentional data exposure. Example topics include mis-delivery of sensitive data, losing a portable end-user device, or publishing data to unintended audiences.
14.6	Protect	<b>Train Workforce Members on Recognizing and Reporting Security Incidents</b> Train workforce members to be able to recognize a potential incident and be able to report such an incident.
14.7	Protect	<b>Train Workforce on How to Identify and Report if Their Enterprise Assets are Missing Security Updates</b> Train workforce to understand how to verify and report out-of-date software patches or any failures in automated processes and tools. Part of this training should include notifying IT personnel of any failures in automated processes and tools.
14.8	Protect	<b>Train Workforce on the Dangers of Connecting to and Transmitting Enterprise Data Over Insecure Networks</b> Train workforce members on the dangers of connecting to, and transmitting data over, insecure networks for enterprise activities. If the enterprise has remote workers, training must include guidance to ensure that all users securely configure their home network infrastructure.

# CIS CONTROL 15 Service Provider Management

## Overview

Develop a process to evaluate service providers who hold sensitive data, or are responsible for an enterprise's critical IT platforms or processes, to ensure these providers are protecting those platforms and data appropriately.

## Why It Matters?

In our modern, connected world, enterprises rely on vendors and partners to help manage their data or rely on third-party infrastructure for core applications or functions. There have been numerous examples where third-party breaches have significantly impacted an enterprise; for example, as early as the late 2000s, payment cards were compromised after attackers infiltrated smaller third-party vendors in the retail industry. More recent examples include ransomware attacks that impact an enterprise indirectly, due to one of their service providers being locked down, causing disruption to business. Or worse, if directly connected, a ransomware attack could encrypt data on the main enterprise. Third-party providers serve as attractive targets for cyber-attacks due to the level of access they afford actors into the clients' networks and the ease with which actors can affect multiple victims by compromising one entity.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
15.1	Identify	<b>Establish and Maintain an Inventory of Service Providers</b> Establish and maintain an inventory of service providers. The inventory is to list all known service providers, include classification(s), and designate an enterprise contact for each service provider. Review and update the inventory annually, or when significant enterprise changes occur that could impact this Safeguard.

## Tools and Resources

# CIS CONTROL 17 Incident Response Management

**Overview** Establish a program to develop and maintain an incident response capability (e.g., policies, plans, procedures, defined roles, training, and communications) to prepare, detect, and quickly respond to an attack.

**Why It Matters?** A comprehensive cybersecurity program includes protections, detections, response, and recovery capabilities. Often, the final two get overlooked in immature enterprises, or the response technique to compromised systems is just to re-image them to original state, and move on. The primary goal of incident response is to identify threats on the enterprise, respond to them before they can spread, and remediate them before they can cause harm. Without understanding the full scope of an incident, how it happened, and what can be done to prevent it from happening again, defenders will just be in a perpetual “whack-a-mole” pattern.

## Safeguards

SAFEGUARD	NIST CSF SECURITY FUNCTION	TITLE/DESCRIPTION
17.1	Respond	<b>Designate Personnel to Manage Incident Handling</b> Designate one key person, and at least one backup, who will manage the enterprise's incident handling process. Management personnel are responsible for the coordination and documentation of incident response and recovery efforts and can consist of employees internal to the enterprise, third-party vendors, or a hybrid approach. If using a third-party vendor, designate at least one person internal to the enterprise to oversee any third-party work. Review annually, or when significant enterprise changes occur that could impact this Safeguard.
17.2	Respond	<b>Establish and Maintain Contact Information for Reporting Security Incidents</b> Establish and maintain contact information for parties that need to be informed of security incidents. Contacts may include internal staff, third-party vendors, law enforcement, cyber insurance providers, relevant government agencies, Information Sharing and Analysis Center (ISAC) partners, or other stakeholders. Verify contacts annually to ensure that information is up-to-date.
17.3	Respond	<b>Establish and Maintain an Enterprise Process for Reporting Incidents</b> Establish and maintain an enterprise process for the workforce to report security incidents. The process includes reporting timeframe, personnel to report to, mechanism for reporting, and the minimum information to be reported. Ensure the process is publicly available to all of the workforce. Review annually, or when significant enterprise changes occur that could impact this Safeguard.

# Conclusion

IG1 (essential cyber hygiene) is a foundational set of cyber defense Safeguards that every enterprise (especially those with limited resources or expertise) should apply to guard against the most common attacks, and represents a minimum standard of information security for all enterprises. Essential cyber hygiene is the on-ramp to the CIS Controls. From there, enterprises may find that they need to implement higher-level CIS Safeguards, such as those found in IG2 and IG3, as their risk profiles increase. Each IG builds upon the previous one: IG2 includes IG1, and IG3 includes all CIS Safeguards in IG1 and IG2.

This guide aims to provide essential cyber hygiene activities from the CIS Controls, as well as their relationship to the NIST Cybersecurity Framework. Implementation of these practices through an MS- and EI-ISAC membership, a SecureSuite Membership, and other additional tools and resources will lead to a more formalized cybersecurity program to mitigate common threats.

## APPENDIX A:

# Policy Templates

The MS-ISAC provides (Courtesy of the State of New York and the State of California) the following policy templates that can be customized and used as an outline of an organizational policy, with additional details to be added by the enterprise.

### Identify

- Acceptable Use of Information Technology Resources Policy
- Access Control Policy
- Account Management/Access Control Standard
- Identification and Authentication Policy
- Information Security Policy
- Security Assessment and Authorization Policy
- Security Awareness and Training Policy
- System and Communications Protection Policy

**CIS Controls Assessment Specification:** Provides an understanding of what should be measured in order to verify that the Safeguards are properly implemented.

---

**CIS Controls Navigator:** Learn more about the Controls and Safeguards and see how they map to other security standards (e.g., CMMC, NIST SP 800-53 Rev. 5, PCI DSS, MITRE ATT&CK).

---

**CIS Controls Self Assessment Tool (CIS CSAT):** Enables enterprises to assess and track their implementation of the CIS Controls for Versions 8 and 71.

---

**CIS Community Defense Model (CDM) v2:** A guide published by CIS that leverages the open availability of comprehensive summaries of attacks and security incidents, and the industry-endorsed ecosystem that is developing around the MITRE ATT&CK (Adversarial Tactics, Techniques, and Common Knowledge) Model.

---

**CIS Risk Assessment Method (CIS RAM) v2.1:** An information security risk assessment method that helps enterprises implement and assess their security posture against the CIS Controls.

---

**CIS SecureSuite Membership:** No-cost membership to SLTTs, with access to CIS-CAT Pro Assessor, CIS Build Kits, CIS Benchmarks, and more.

---

**CIS Benchmarks:** Secure configuration guidelines for 100+ technologies, including operating systems, applications, and network devices.

---

**CIS-CAT Pro:** Tool to scan for proper CIS Benchmark configurations for applications, operating systems, and network devices.

---

**CIS Build Kits:** ZIP files that contain a Group Policy Object (GPO) for each profile within the corresponding CIS Benchmark.

---

**CIS Hardened Images<sup>®</sup>:** Virtual machine images securely pre-configured to the CIS Benchmarks.

---

**CIS WorkBench:** Get involved in one of our many communities.

---

**CIS Password Policy Guide:** CIS Guidance for secure usage of passwords in an enterprise

---

**MS-ISAC Membership:** Free for all 50 states, the District of Columbia, U.S. territories, local and tribal governments, public K-12 education entities, public institutions of higher education, authorities, and any other non-federal public entity in the U.S.

---

**EI-ISAC Membership:** Free for all SLTT government organizations that support the elections officials of the U.S., and associations thereof.

---

**MS-ISAC Cybersecurity Resources Guide:** Mapping of various resources to NIST CSF.

---

**Malicious Domain Blocking and Reporting:** MS- and EI-ISAC DNS filtering service that prevents IT systems from connecting to harmful web domains.

---

**Nationwide Cybersecurity Review (NCSR):** No-cost, anonymous, annual self-assessment designed to evaluate cybersecurity maturity.

---

**NIST CSF Policy Template Guide:** Resource to assist with the application and advancement of cybersecurity policies.

---

**No-Cost and Fee-Based Listing of MS-ISAC/EI-ISAC Services:** Overview of available services. Contact [info@cisecurity.org](mailto:info@cisecurity.org) for more information.

## APPENDIX C:

# Acronyms and Abbreviations

**CIRT:** Cyber Incident Response Team

**CIS:** Center for Internet Security

**CIS-CAT:** CIS Configuration Assessment Tool

**CIS CDM:** CIS Community Defense Model

**CIS CSAT:** CIS Controls Self Assessment Tool

**CISA:** Cybersecurity and Infrastructure Security Agency

**CMMC:** Cybersecurity Maturity Model Certification

**CVEs:** Common Vulnerabilities and Exposures

**DNS:** Domain Name System

**DoD:** U.S. Department of Defense

**EI-ISAC:** Elections Infrastructure Information Sharing and Analysis Center

**FedVTE:** Federal Virtual Training Environment

**GPO:** Group Policy Object

**GUI:** Graphical User Interface

**HTTP:** Hypertext Transfer Protocol

**HTTPS:** Hypertext Transfer Protocol Secure

**IG:** Implementation Group

**IG1:** Implementation Group 1

**IG2:** Implementation Group 2

**IG3:** Implementation Group 3

**IoT:** Internet of Things

**IT:** Information Technology

**LDAP:** Lightweight Directory Access Protocol

**MCAP:** Malicious Code Analysis Platform

**MDM:** Mobile Device Management

**MFA:** Multi-Factor Authentication

**MMC:** Microsoft Management Console

**MS-ISAC:** Multi-State Information Sharing and Analysis Center

**MSP:** Managed Service Provider

**NAC:** Network Access Control

**NaaS:** Network as a Service

**NCSR:** Nationwide Cybersecurity Review

**NIST:** National Institute of Standards and Technology

**NIST CSF:** NIST Cybersecurity Framework

**PCI DSS:** Payment Card Industry Data Security Standard

**SBP:** Security Best Practices

**SOC:** Security Operations Center

**SLTT:** State, Local, Tribal, and Territorial governments

**SP:** Special Publication

**SSH:** Secure Shell

**Telnet:** Teletype Network Protocol

**URL:** Uniform Resource Locator

The Center for Internet Security, Inc. (CIS<sup>®</sup>) makes the connected world a safer place for people, businesses, and governments through our core competencies of collaboration and innovation. We are a community-driven nonprofit, responsible for the CIS Critical Security Controls<sup>®</sup> and CIS Benchmarks™, globally recognized best practices for securing IT systems and data. We lead a global community of IT professionals to continuously evolve these standards and provide products and services to proactively safeguard against emerging threats. Our CIS Hardened Images<sup>®</sup> provide secure, on-demand, scalable computing environments in the cloud.

CIS is home to the Multi-State Information Sharing and Analysis Center<sup>®</sup> (MS-ISAC<sup>®</sup>), the trusted resource for cyber threat prevention, protection, response, and recovery for U.S. State, Local, Tribal, and Territorial government entities, and the Elections Infrastructure Information Sharing and Analysis Center<sup>®</sup> (EI-ISAC<sup>®</sup>), which supports the rapidly changing cybersecurity needs of U.S. election offices.
